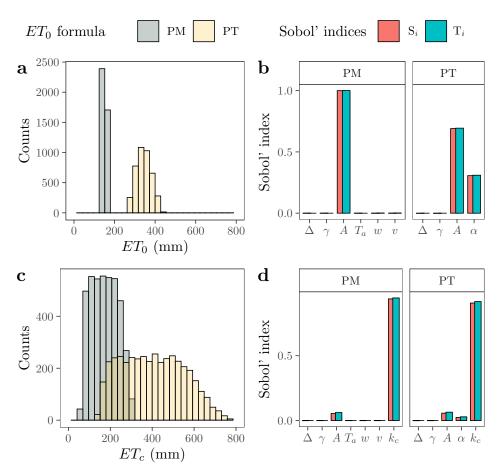

Figure 4: Monte-Carlo based, global uncertainty and sensitivity analysis of the Penman-Monteith (PM) and the Priestley-Taylor (PT) methods. The red bar indicates the first-order effect  $S_i$ , i.e. the proportion of variance conveyed by each model input. The blue bar reflects the total-order effect  $T_i$ , which includes the first-order effect of the parameter plus the effect derived of its interaction with the rest. The parameters were described with the probability distributions shown in Table~1. See the Supplementary Materials for a technical explanation of global uncertainty and sensitivity analysis. a) Empirical distribution of  $ET_0$ . b) Sobol' indices. c) Empirical distribution of  $ET_c$ . We described  $k_c$  as U(0.47, 1.86) to reproduce the range reported at month 5 by Nichols et al. (2004) for developing salt cedars in the Bosque del Apache, New Mexico (see Figure~3a). d) Sobol' indices.

```

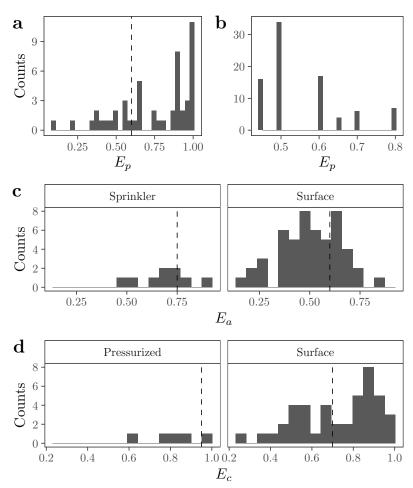

Figure 5: Data on irrigation efficiency. a) Distribution of project efficiencies  $(E_p)$  in USA according to Solley, Pierce, and Perlman (1998), calculated as Total water withdrawal / consumptive water use. The vertical dashed line is the  $E_p$  value used by Döll and Siebert (2002) to characterize the irrigation efficiency of USA. b) Distribution of project efficiencies  $(E_p)$  for Africa reported by FAO (1997). c) Distribution of field application efficiencies  $(E_a)$  in surface and sprinkler irrigation systems according to Bos and Nugteren (1990). Surface includes furrow, basin and border irrigation systems. The dashed vertical lines mark the  $E_a$  point estimates selected by Rohwer, Gerten, and Lucht (2007). d) Distribution of conveyance efficiencies  $(E_c)$  in surface and pressurized (sprinkler) irrigation systems according to Bos and Nugteren (1990). The vertical, dashed black lines show the  $E_c$  point estimates used by Rohwer, Gerten, and Lucht (2007).

# # EFFICIENCIES AS A FUNCTION OF SCALE dt.tmp <- bos.dt[, Scale := ifelse(Irrigated\_area < 10000, "\$<10.000\$ ha", "\$>10.000\$ ha" )] %>% na.omit() melt(dt.tmp, measure.vars = c("\$E\_c\$", "\$E\_a\$", "\$E\_d\$")) %>% ggplot(., aes(value)) + geom\_histogram() + labs(x = "Value", y = "Counts") + facet\_grid(Scale ~ variable) + theme\_AP()

## `stat\_bin()` using `bins = 30`. Pick better value with `binwidth`.

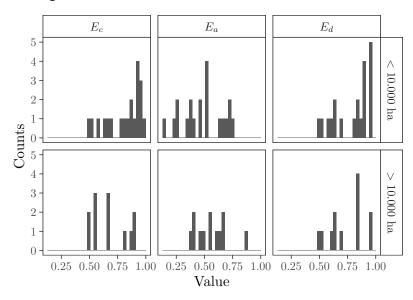

Figure 6: Partial efficiencies as a function of scale according to the data compiled by Bos and Nugteren (1990).  $E_d$  stands for distribution efficiency and refers to the water delivery from the source to a specific outlet.  $E_d$  is replaced by Rohwer, Gerten, and Lucht (2007) with  $M_f$ .
